

# Performance Testing

Date: 29 September 2026

Team ID: SWTID-2026-8065

Project Name: Implement Client Script & UI Policy (Incident)

Maximum Marks: 5 Marks

## Performance Testing:

This document records the overall approach to performance testing for the ServiceNow Incident implementation. The focus is on verifying that UI Policies and Client Scripts (onChange, onSubmit, onCellEdit) execute quickly, provide clear user feedback, and do not degrade form usability.

## Test Objectives:

1. Validate mandatory enforcement when Impact is High.
2. Verify auto-setting of Urgency based on Impact.
3. Confirm save blocking when Assigned To is missing for High Impact.
4. Ensure list-edit blocking for State field.
5. Check that messages and mandatory indicators are clear.

## Performance Test Results:

| S. No | Test Scenario                     | Test Steps / Input                                     | Expected Result                                                      | Actual Result                                          | Status |
|-------|-----------------------------------|--------------------------------------------------------|----------------------------------------------------------------------|--------------------------------------------------------|--------|
| 1     | UI Policy - Assigned To mandatory | Create Incident, set Impact = High                     | Assigned To becomes mandatory (red asterisk)                         | Assigned To shows mandatory indicator as per UI Policy | Pass   |
| 2     | onChange - Auto Urgency           | Change Impact to High on Incident form                 | Urgency auto-set to High with info message                           | Urgency set to High, info message displayed            | Pass   |
| 3     | onSubmit - Validate Assigned To   | Set Impact=High, leave Assigned To empty, click Submit | Save blocked with error 'Assigned To is mandatory for High Impact'   | Save blocked, error message shown, record not saved    | Pass   |
| 4     | onCellEdit - Block State edit     | Open Incident list, try to edit State via list         | Edit blocked with alert 'State cannot be updated using list editing' | Alert shown, list edit prevented                       | Pass   |
| 5     | UI Policy - Urgency behavior      | Impact=High -> check Urgency field action              | Urgency mandatory/read-only as per policy action                     | Urgency behavior enforced as per policy                | Pass   |
| 6     | Form load & script execution      | Open New Incident form, trigger onChange               | Form loads <2 sec, scripts execute <1 sec, no console errors         | Form load ~1.34 sec, script ~82ms, 0% error rate       | Pass   |

## Performance Summary:

| Metric                | Target    | Actual / Observed            | Remarks                       |
|-----------------------|-----------|------------------------------|-------------------------------|
| Form Load Time        | <2 sec    | ~1.34 sec                    | Within target, no degradation |
| Script Execution      | <1 sec    | ~82ms                        | Fast client-side execution    |
| UI Policy Enforcement | Immediate | Immediate on condition match | Mandatory indicator instant   |
| Error Handling        | Graceful  | Error/Info messages shown    | User-friendly messages        |
| Error Rate            | <1%       | 0%                           | All 6 scenarios passed        |

Overall Result: All performance tests passed. Implementation meets functional and usability expectations for Incident management with UI Policies and Client Scripts. Team SWTID-2026-8065 - B Sivaranjani, S Sabeena Begum, K Bhavadharani, V Prithika, F Snegavini.
